Guide notes: safe batteries at home

For your parent or guide · 1 page

Safe to use

- AA or AAA batteries, 1.5 V each
- A 9 V battery for short tests only
- Small bulbs, LEDs, buzzers and switches from a kit

Never

- Never use mains electricity or wall sockets.
- Never connect + straight to – with a wire: it gets hot fast.
- Never open or burn batteries. Recycle used ones.

If a wire gets warm: disconnect it straight away. That’s a short circuit.
